Some lossless audio formats use lossless coding techniques to gain a ratio of size to quality over lossy encoding. In lossless compression, some amount of data, but not inessential data, is discarded to gain compressed audio data. The term lossless is often used to denote that the data is compressed without losing any real information, so that the original data can be recovered exactly or nearly exactly, even if the original was recorded at a higher rate than was used to store the compressed data. The term lossless may also be applied to lossy audio codecs that maintain a fairly high quality of reproduction. Lossless encoders Lossless compression methods can be classified into different categories such as waveform coding, filter banks, and spectral coding. Waveform-based lossless codecs compress a signal by encoding its time-varying representation with minimal distortion. These are typically implemented using the concept of time-frequency masking, using phase-locked loops as well as algorithmic systems that search for common time-frequency structures. The block-wise time-frequency masking methods from psychoacoustics are exploited
